Ultrasonically Controlled Ruby Laser Pulses!*

This composite photograph, taken in the United Aircraft Research Laboratories, illustrates the first reported successful application of ultrasonics as a means of controlling the normally random pulses emitted by a ruby laser.

- A. a segment of such a train of ruby pulses.
- B. the applied ultrasonic signal (182 Kcs.).
- C. the ultrasonically controlled pulses which are synchronized with the sinusoidal waveform shown in (B).

If you are interested and qualified to undertake theoretical or experimental laser investigations, please write to Mr. E. A. Ciriack.

**MORE
TIME
TO
THINK**

.... AT ORI The accent is on thought... on providing an excellent scientific environment for work and exchange of ideas (as befits an organization controlled and directed by scientists).

The result: productive effort. ORI has *doubled* its business volume every year since 1956 and the expansion goes on unabated. Consequently, we have unusual opportunities for engineers and scientists interested in analyzing operational and executive decision problems in astronautics, missile systems, undersea and surface warfare, and industrial transportation systems.

You will deal with top level technical and management personnel... you will work on critical national problems... your financial rewards will reflect the importance of your work and are worthy of your attention.

ACTUAL RECORD OF MODEL 36 PERFORMANCE

Cary Model 36 VIBRATING REED AMPLIFIER

Combines exceptional response and sensitivity...

Fast Response: DC to 10 cps

High Gain: 2×10^8 for currents as small as 10^{-15} amp

High Stability: 10^{-15} amp or less zero drift per hour

Wide Dynamic Range: 100,000 to 1

With its combination of outstanding performance features...fast response, low zero drift, amplification of extremely wide variations in current without a change in range setting...the Cary Model 36 provides exceptional performance for measurement of small currents where response speed and stability are of primary concern.

Applications include: amplification of small currents in the rapid scanning of high mass numbers with analytical mass spectrometers; measuring of electrical properties of insulators and semiconductors; rapid measurement of nuclear and X-radiations, photoelectric, and other electron emission phenomena.

The Model 36 is available with output to drive indicators and recorders such as oscilloscopes, multiple galvanometers, fast pen recorders, and digitizing equipment.

For details about the performance and operation of the Cary Model 36, ask for Data File P20-13.
