

ters in the just-published second part present summaries as of 1957 or 1958 and are unfortunately now out of date. It would have been helpful if for each article the closing date of the literature survey had been given.

Most of the experiments described in the second volume are measurements of partial and total neutron cross sections. Other articles discuss measurements of neutron polarization and of neutron spectra, as well as measurements of gamma rays associated with inelastic scattering of neutrons and with neutrons from charged-particle induced reactions.

Special mention should be made of the chapters on nuclear theory which will be of interest also to physicists not specifically working with fast neutrons. These chapters treat the optical model (W. S. Emmerich), direct reactions (N. Austern), resonances (L. C. Biedenharn), polarization (T. A. Welton), the statistical model (H. Goldstein), fission (J. A. Wheeler), and neutron-proton scattering (J. L. Gammel). Although nuclear theory is changing more slowly than experimental methods, even some of these theoretical contributions suffer from the delay in publication.

Everyone who either does research in nuclear physics or is concerned with nuclear reactors would undoubtedly like to have both volumes of *Fast Neutron Physics* on his bookshelf, but unfortunately the price of \$74.00 will keep many from acquiring this useful reference work.

Solid State Theory. By Mendel Sachs. 350 pp. McGraw-Hill, New York, 1963. \$10.75. Reviewed by **Peter Grosewald**, *The Pennsylvania State University*.

Dr. Sachs has deliberately limited his book both as to scope and to audience, and has written an excellent book within that framework.

Important aspects of the book from a pedagogical point of view are the sharp and repeatedly emphasized distinction between reality and ideality, extensive use of footnotes rather than a general bibliography, the inclusion of problems (one or two per chapter), purely for illustrative purposes rather than as part of the text; chapter summaries, and, most important of all, continuity of subject matter. The

level of the over-all text is not uniform but is counterbalanced by the logical sequence of presentation.

In terms of actual content the text attempts to present the most modern aspects of solid-state theory, i.e., the collective description of the cohesive energy of solids (Bohm-Pines) as well as the Wigner-Seitz theory, both treated extensively in Chapter 10.

Brillouin zones and the reciprocal lattice aren't introduced until a thorough background of one-electron scattering theory in simplified systems is assured. The book is primarily concerned with two basic features of solids, the symmetry properties and the electronic band structure which arises because of the former. The approach to these properties is controlled by the nature of the main intended audience, those with an interest in theoretical physics, and so group theory is used to derive the symmetry properties of crystals and the two are used in turn to develop crystalline field theory.

On the debit side, and unfortunately, within the designated framework, there are several points to consider before choosing *Solid State Theory* as a text. The limitation to only two features (which do cover a wide range) of the physical properties and the relatively small size of the book hinder using it as a replacement for one of the older "standard" texts. There is only one chapter essentially devoted to relating theoretical predictions and experimental observations, but in compensation, allusions to experimental confirmation are frequent in the footnotes.

In summary, the book is to be wholeheartedly recommended for the library of the general theoretician, solid-state physicist, and those in allied fields, but with reservations as a text for a general introductory solid-state course.

An Introduction to Waves, Rays and Radiation in Plasma Media. By J. J. Brandstatter. 690 pp. McGraw-Hill Book Co., Inc., New York, 1963. \$15.00. Reviewed by **Sanborn C. Brown**, *Massachusetts Institute of Technology*.

Plasmas at the present time are relatively poorly understood, and much that is known about them comes more from phenomenological and intuitive approaches than from detailed mathematical analyses of conditions which

may or may not have physical reality. For this reason the preoccupation with mathematical exactness generally prevents the author of this book from coming to grips with the physical plasma itself. The selected topics chosen by the author are developed very well but in great detail. In fact, the author often dwells so long on the minutiae and fine points of the mathematical analysis that the book often becomes dry and tedious.

In the introduction the author states that he "aims the text at the senior-graduate university student." This is a very commendable aim but I think that this is just what the text does not do. Nowhere in the book are there any down-to-earth examples or order-of-magnitude calculations to see what factors are physically real and what factors, although mathematically interesting do not add to our understanding of the plasma mechanisms. It is, in fact, a reference book for the specialist on the several selected topics of interest to the author. It certainly could not be recommended as the basis of a graduate course.

As a comprehensive text of waves in plasma, the book leaves out too many important mechanisms to be a valid and balanced graduate-school text. It mentions only briefly such things as spatial dispersion, says nothing about instabilities and growing waves, and shuns all but collisional damping. The reason for leaving some of the important mechanisms out is a great puzzle to this reviewer. For example, the author states that Landau damping is not treated because it requires complex variable theory. On the other hand, all through the book, tensor calculus is expected to be a basic working tool of the reader, and Fourier transforms are used whenever convenient. Yet mathematical complexity cannot be the reason for the omission of such things as cyclotron damping, since the degree of mathematical sophistication for a treatment of this subject is certainly less than that of many of the theoretical tools used throughout the book.

There is no reference whatever to experimental observations or any treatment of real plasmas. The book is the outgrowth of lecture notes on the theory and application of ray propaga-

RADIOISOTOPES

SEALED SOURCES
OR SOLUTIONS

\$3.00 UP

1-DAY AIRMAIL
DELIVERY

We keep a large supply of Radioisotopes on hand for immediate delivery. 1/2 microcurie sources in sealed plastic disks or in solution, \$3.00, plus postage. Maximum activity "license free" sources, \$6.00 up. All sources individually calibrated to $\pm 10\%$. Add \$20.00 per source for $\pm 3\%$ calibration. Call or wire today and your sources will be air shipped by tomorrow morning. Special delivery schedules for short half-life Radioisotopes on West Coast. Overnight quotations on special sources and source configurations. Phone: 415-837-7241.

3100 Crow Canyon Road, San Ramon, California
Subsidiary Cenco Instruments Corporation

SOLID STATE PHYSICIST

The Bendix Research Laboratories Division has a challenging opportunity for a highly qualified scientist experienced in

RESONANCE PHENOMENA IN SOLIDS.

An intimate acquaintance with spin resonance phenomena, and the ability to deduce structural models from experimental observations is desirable. PhD in Physics required. Excellent experimental facilities are available in the laboratory, and scientists are encouraged to publish research results. Submit resume in confidence to: A. Capsalis, Director of Personnel, The Bendix Corporation, Research Laboratories Division, Southfield, Michigan.

1964 Texts

Introduction to Electronics:

For Students of Physics and Engineering Science

Donald M. Hunten, University of
Saskatchewan

This unusual text fills a decided need—a complete introduction to electronics for the student whose specialty lies elsewhere. Assuming a knowledge of elementary electricity and magnetism, as well as differential equations, it gives important coverage to such topics as phase-sensitive detectors, negative feedback, d-c amplifiers, and the limitation of sensitivity by noise.

January, 1964 400 pp. \$7.25 (tentative)

Introduction to Elasticity

Gerard Nadeau, Laval University

This modern text provides a complete introduction to elasticity with a minimum of mathematical complications. Vectors and dyadics are used both for developing theory and solving problems. Algebraic and trigonometric functions are used almost exclusively (only three paragraphs refer to Bessel functions). The theorems of Gauss, Stokes, and Green are presented in their most general form, then followed by specific applications. The gradient operator, too, is defined in the broadest sense, independent of any particular coordinate system.

March, 1964 250 pp. \$6.00 (tentative)

Elements of Plasma Physics

Solomon Gartenhaus, Purdue University

An important new text on an increasingly important subject, Dr. Gartenhaus's book provides a complete introduction that is a sound balance of theory and application. Plasma physics is approached from a non-equilibrium statistical mechanical point of view for the 2nd year graduate student of physics and engineering. Included are such recent developments as the methods of Rostoker and Rosenbluth, Chew, Goldenberger, and Low. Stimulating problems and thought-provoking applications are used throughout, and a section on information theory is included.

March, 1964 250 pp. \$7.25 (tentative)

**HOLT, RINEHART

Toronto 18, Ontario

tion in plasma media and is a photo-offset reproduction of an IBM-typed (unjustified) manuscript and is not in a printed form.

There is no question that this book will be of great interest to the specialist who wants the mathematical minutiae of particular subjects. It is

carefully detailed in its theoretical treatment of the mathematical steps necessary to arrive at the required solution of particular problems and, as such, should be available for the use of all theoretical plasma physicists. On the other hand, the general reader may not find the material sufficiently

inclusive or physical for his purposes. If used in a graduate course, even the problems which are given at the end of the text will be those of interest in terms of the mathematical analysis of plasma theory rather than a balanced coverage of waves, rays, and radiation in plasma media.

BOOKS RECEIVED

ASTRONOMY & ASTROPHYSICS

Astrophysics and the Many-Body Problem. Summer Inst. (Brandeis U., 1962). By E. N. Parker, J. S. Goldstein, A. A. Maradudin, V. Ambegaokar. 438 pp. Benjamin, New York, 1963. Cloth, \$9.00; paper, \$5.95.

ATOMIC & MOLECULAR PHYSICS

Electrons in Atoms. By G. F. Lothian. 196 pp. Butterworths, London, 1963. \$6.95.

BIOPHYSICS & MEDICAL PHYSICS

Quantum Biochemistry. By Bernard Pullman and Alberte Pullman. 867 pp. Interscience, New York, 1963. \$27.50.

CHEMISTRY & CHEMICAL PHYSICS

Surface Properties of Silicate Glasses. By György Korányi. Transl. from Hungarian by Ferenc Tamás. 104 pp. Akadémiai Kiadó, Budapest, 1963.

Modern Approach to Inorganic Chemistry. C. F. Bell and K. A. K. Lott, eds. 293 pp. Butterworths, London, 1963. \$8.95.

Zone Melting of Organic Compounds. By E. F. G. Herington. 162 pp. Wiley, New York, 1963. \$5.95.

Coordination Chemistry. Conf. Proc. (Sweden, June 1962). 123 pp. Butterworths, London, 1963. \$5.00.

COMPUTATION & COMMUNICATION

The Mathematical Theory of Communication. By Claude E. Shannon and Warren Weaver. 117 pp. Univ. of Illinois Press, Urbana, 1963. 95 cents.

ELECTRICITY & MAGNETISM

Progress in Dielectrics, Volume 5. J. B. Birks and J. Hart, eds. 368 pp. Academic, New York, 1963. \$13.00.

Micromagnetics. By William Fuller Brown, Jr. 143 pp. Interscience, New York, 1963. \$5.95.

EXPERIMENTAL TECHNIQUES

Cryogenic Technology. Robert W. Vance, ed. 585 pp. Wiley, New York, 1963. \$19.50.

Handbook of High Vacuum Engineering. By H. A. Steinherz. 358 pp. Reinhold, New York, 1963. \$11.75.

GEOPHYSICS & EARTH SCIENCES

Advances in Upper Atmosphere Research. NATO Advanced Study Inst. (Corfu, 1960). B. Landmark, ed. 340 pp. (Pergamon, Oxford). Macmillan, New York, 1963. \$12.25.

HANDBOOKS, TABLES, ETC.

Reactor Physics Constants (2nd Ed.). 850 pp. USAEC. Distr. by US Government Printing Office, Washington, D. C., 1963. \$6.00.

German-English Dictionary of Glass, Ceramics and Allied Sciences. By Thomas H. Elmer. 304 pp. Interscience, New York, 1963. \$15.00.

The Identification of Molecular Spectra (3rd ed.). By R. W. B. Pearse and A. G. Gaydon. 347 pp. Wiley, New York, 1963. \$18.50.

Organic Electronic Spectral Data, Volume 4, 1958-59. J. P. Phillips and F. C. Nachod, eds. 1179 pp. Interscience, New York, 1963. \$20.00.

HISTORY & PHILOSOPHY OF SCIENCE

The New World of Physics. By Arthur March and Ira M. Freeman. 195 pp. Random House, New York, 1962. \$4.95.

Scientific Change. Historical Studies in the Intellectual, Social, and Technical Conditions for Scientific Discovery and Technical Invention, from Antiquity to the Present. Symp. Proc. (Oxford U., July 1961). A. C. Crombie, ed. 896 pp. Basic Books, New York, 1963. \$17.50.

MATHEMATICS

Linear Differential Equations in the Real Domain. By Kenneth S. Miller. 193 pp. W. W. Norton, New York, 1963. \$5.75.

Multilinear Analysis for Students in Engineering and Science. By G. A. Hawkins. 219 pp. Wiley, New York, 1963. Paper, \$2.95; cloth, \$6.50.

Basic Mathematics for the Physical Sciences. By Haym Kruglak and John T. Moore. 354 pp. McGraw-Hill, New York, 1963. Paper, \$3.95.

NUCLEAR PHYSICS

Nuclear Chemistry. By Noah R. Johnson, Eugene Eichler, G. Davis O'Kelley. Vol. 2 of *Technique of Inorganic Chemistry*, edited by Hans B. Jonassen and Arnold Weissberger. 202 pp. Interscience, New York, 1963. \$8.00.

The Nucleon-Nucleon Interaction. Experimental and Phenomenological Aspects. By Richard Wilson. 249 pp. Interscience, New York, 1963. \$6.00.

Direct Interactions and Nuclear Reaction Mechanisms. Conf. Proc. (Univ. of Padua, Sept. 1962). E. Clementel and C. Villi, eds. Vol. 1 of *Nuclear Physics*, edited by L. Lederman and J. Weneser. 1187 pp. Gordon and Breach, New York, 1963. \$39.50.

Recent Research on Beta-Disintegration. By A. I. Alikhanov. Transl. from Russian by William E. Jones. 130 pp. (Pergamon, Oxford) Macmillan, New York, 1963. \$3.00.

NUCLEAR POWER & TECHNOLOGY

The Design of Gas-Cooled Graphite-Moderated Reactors. D. R. Poulter, ed. 692 pp. Oxford, New York, 1963. \$13.45.

Radiation Damage in Solids, Vol. 3. Symp. Proc. (Venice, May 1962). IAEA, Vienna, 1963. 187 pp. Distr. in US by Nat'l Agency for Internat'l Publications, New York, 1963. Paper, \$4.00.

OPTICS & SPECTROSCOPY

Photoelasticity. Symp. Proc. (Chicago, Oct. 1961). M. M. Frocht, ed. 294 pp. Pergamon, London, 1963. Distr. in US by Macmillan, New York. \$14.00.

Masers and Lasers (2nd ed.). Molecular Amplification and Oscillation by Stimulated Emission. By Gordon Troup. 192 pp. (Methuen, London) Wiley, New York, 1963. \$4.50.

PHYSICS OF FLUIDS

The Mathematical Theory of Viscous Incompressible Flow. By O. A. Ladyzhenskaya. Revised English ed. transl. from Russian by Richard A. Silverman. Vol. 2 of *Mathematics and its Applications*, edited by Jacob T. Schwartz. 184 pp. Gordon and Breach, New York, 1963. \$9.50.
