

LETTERS

of recent physics PhD's received undergraduate training at institutions that, at the time of the undergraduate work, *did not* have graduate physics programs. Also many master's programs are at institutions that are predominantly undergraduate. Accordingly, the statement, "based on NAS data, four-year colleges will provide

the number has risen more in biological-science doctorates. In contrast, *leading* baccalaureate sources of doctorates have grown more rapidly in undergraduate enrollments than as baccalaureate sources of doctorates in science. Their contribution to physical-science doctorates in contrast with biological sciences has increased a good deal more. Technical institutions are more similar to undergraduate colleges,

Table 2. Increases in Science-Doctorate Origins and Enrollments (%)

Type of institution	Increase as source of science PhD's*			Undergraduate enrollment increase Fall 1951 to Fall 1958
	Physical sciences	Biological sciences	All sciences	
Great Lakes College Association ^a	+47	+46	+47	+22
Associated Colleges of the Midwest ^b	+81	+107	+88	+16
Central States College Association ^c	+22	+76	+56	+41
Three regional groups ^d	+64	+125	+82	+8
Leading private liberal arts colleges ^e	+59	+90	+68	+11
Leading sources of PhD's ^f	+40	+12	+30	+36
Leading technical institutions ^g	+98	+33	+93	+20

* Baccalaureate sources of PhD's awarded in 1950-59 as opposed to those awarded in 1961-65. The latter were multiplied by two and the percent increase then calculated.

^a Albion, Antioch, Denison, DePauw, Earlham, Hope, Kalamazoo, Kenyon, Oberlin, Ohio-Wesleyan, Wabash, Wooster

^b Beloit, Carleton, Coe, Cornell (Iowa), Grinnell, Knox, Lawrence, Monmouth, Ripon, Olaf

^c Alma, Augustana, Carroll, Gustavus Adolphus, Illinois-Wesleyan, Luther, MacMurray, Manchester, Millikin, Mundelein, St. John's (Minn.), Simpson

^d Amherst, Mount Holyoke, Smith, Bryn Mawr, Haverford, Swarthmore, Pomona, Occidental, Redlands, Whittier

^e Oberlin, Dartmouth, Swarthmore, Amherst, Reed, Wooster, Vassar, Union, Wellesley, Mount Holyoke

^f California-Berkeley, CCNY, Illinois, Chicago, Wisconsin, Harvard, Minnesota, Michigan, Columbia, Cornell

^g MIT, Cal Tech, Carnegie, Rensselaer, Rice, Lehigh, IIT, Brooklyn Polytech, VPI, Case Inst.

only 11% of future physics PhD's," is highly speculative and will probably not be borne out by future events.

Undergraduate enrollments have increased at different rates in different types of institutions. Undergraduate enrollment increases should, therefore, be compared with science-doctorate contributions for various types of institutions. This has been done recently by Albert B. Stewart (physics department, Antioch College). The results are in table 2.

These statistics do not give a complete picture, and physics is not explicitly identified. However *all* undergraduate colleges have increased their number of science doctorates by a greater percentage than their enrollments have increased. In most cases

with much larger source increases than enrollment increases. Their contribution to physical-science doctorates has risen much more than that to biological sciences. These statistics certainly present a different and far more favorable picture of undergraduate institutions as doctorate sources than that indicated by the PHYSICS TODAY report.

ROBERT H. LINNELL
National Science Foundation

A CORRECTION: PHYSICS TODAY stated my address incorrectly in September. Since June 1966 I have been an associate professor of astronomy at the University of Arizona, Tucson and in the Lunar and Planetary Laboratory.

ELIZABETH ROEMER

High Accuracy PRESSURE/VACUUM Measurements with TENSIONED DIAPHRAGM GAGE

A thin metal membrane is stretched mirror-flat under tension "T", forming an extremely sensitive diaphragm. Differential pressure P_1-P_2 is measured by variation of capacitance to adjacent electrodes as diaphragm deflects.

THE MKS BARATRON™

is a direct reading capacitance manometer which measures true total pressures independent of gas nature or composition.

* **HIGH ACCURACY** — suitable for use as calibration standard. Performance rivals or exceeds McLeod gauge.

* **RANGE** — 1000 torr to as low as 1×10^{-5} torr, (10⁻⁷ to 20 psi). Observable precision is 10⁻⁵ torr (10⁻⁷ torr resolution via DC output).

* **VERSATILE** — Remotely operable to 1000'. Three-way readout, including high-accuracy, 5-place digital dials. Recording and/or control functions. Offset, expanded, and multiscale (8) operation. Absolute or differential measurements. Self-checking, zero-adjust feature.

NOW!
**450°C
BAKEOUT**

THE NEW SERIES 90 MKS BARATRON represents a major advance in vacuum measurement capability. All-welded metal and ceramic construction (no organics)

permits bakeout to 450°C and continuous operation at high temperature. Design emphasizes high physical and thermal stability. Ideal for ultrahigh purity work including mass spectrometer inlets; gas analyses, metering, mixing, and backfill; condensable vapor studies; absorption or decomposition phenomena; nucleonics; vacuum metallurgy.

The complete line of MKS BARATRON instruments includes, in addition to the SERIES 90:

* **THE SERIES 77.** Basic MKS BARATRON with characteristics as described above, except used for moderate temperatures. Hundreds in use on every form of sophisticated research, development, laboratory, test, & calibration apparatus.

* **THE SERIES 100.** Auto-nulling Digital Indicator. Provides self-balancing readouts on 5-place Nixie display, with sixth place overrange and $\pm$ indication, plus parallel 18 bit BCD output for computerized data logging and programmed control applications. Essential where the amount or rate of change of data cannot be handled by manual means.

Illustrated technical brochures by return mail.
