Herzfeld Medal goes to Alvin Radkowsky

Catholic University awarded the first Karl F. Herzfeld Medal to Alvin Radkowsky, a nuclear physics expert with the Navy since 1938 and a former student of Herzfeld's. The medal will be awarded periodically for achievement in the fields of natural, social and applied sciences.

Radkowsky began his work with the Navy's Bureau of Ships in electrical engineering, but after receiving his PhD from Catholic University he began working with nuclear reactors at the Argonne National Laboratory, and he has continued work in this field ever since. Among Radkowsky's accomplishments is the "burnable poison" method of controlling nuclear reactors and extending their endurance.

Gamow Memorial Award goes to Wigner

The University of Colorado has presented the second George Gamow Memorial Lectureship Award to Eugene P. Wigner, 1963 Nobel Prize laureate in physics. He was recognized for his "contributions to the development of physics and to the elucidation of its fundamental concepts."

The Gamow memorial lectures are designed to promote public understanding of the nature and role of science. Wigner spoke on "Symmetry Principles in Nature."

APS prizes to Mueller, Anderson and Robson

During the spring meeting of the American Physical Society in Washington, the Tom W. Bonner Prize in Nuclear Physics was presented to John D. Anderson, of Lawrence Livermore Laboratory and to Donald Robson, of Florida State University, and the Davison-Germer Prize was awarded to Erwin W. Mueller, of Pennsylvania State University.

The Bonner prize, consisting of \$1000 to be shared by the recipients, is sponsored by the friends of Tom Bonner and the Texas Nuclear Corp. Anderson and Robson were recognized for their contributions to the discovery

and understanding of the analog states in complex nuclei, which have "greatly extended the applicability of the concept of isopin symmetry, offered new insights into nuclear dynamics and provided a new conceptual tool for the analysis of the structure of nuclear states."

Donated by Bell Telephone Laboratories, the Davison-Germer Prize consists of \$2500. The prize cites Mueller for "the invention of the field-ion microscope and its application to the study of surfaces at the atomic level."

John W. Boag wins Gray Medal

The International Commission on Radiation Units and Measurements has selected John W. Boag as the second recipient of the L. H. Gray Medal. Boag, professor of physics as applied to medicine at the Institute of Cancer

BOAG

Research and an honorary director of the department of physics of the Royal Marsden Hospital (both in Surrey, UK), will receive the award at the International Congress of Radiology to be held in Madrid, Spain in 1973.

Boag was chosen because of his "outstanding contributions to scientific fields of interest to the ICRU." His research has included work on the theory of recombination in ionization chambers. With E. J. Hart, Boag was

7 WAYS TO AMPLIFY LOW LEVEL SIGNALS...

Without adding noise to foul up your measurements. One popular way is with our Model 113, considered by many users as the world's lowest noise amplifier. The other six ways are neatly packaged into one new instrument, our Model 114 Signal Conditioning Amplifier. By plugging one of six P.A.R. preamps into the 114, you can tailor it to meet a wide range of source impedance and frequency parameters to handle most of your signal processing requirements. And if you have a Model 124 or 126 lock-in you're set to go now, because the preamps from these lock-ins plug into the 114. It all adds up to new flexibility and optimum low noise performance.

And since low noise is what we're selling, consider this: Model 113 has a noise figure of less than 0.3 dB at 10 Hz, with a 2 megohm source resistance; the Model 114's noise figure depends upon the preamp used, and can be as low as .01 dB at 15 Hz, with a 1 megohm source resistance. Both instruments offer these outstanding features:

- Amplification of nanovolt level signals
- Switch selectable ac or dc coupling
- Single ended or differential input
- 6 dB/octave high and low frequency rolloffs
- High common mode rejection
- Price: Model 114—\$595; Model 113—\$795 (Preamps for the 114 range from \$250 to \$525)

For complete information, call us at (609) 452-2111. Or write Princeton Applied Research Corporation, Box 2565, Princeton, N.J. 08540.

When you have
only one chance—

Stop, record, digitize and display even non-repetitive wave forms

Only our all-in-one wave form recorder can do it so conveniently. You can capture even a non-recurring phenomenon in real time, digitize it, and store it in memory. That includes even the data *preceding* your trigger signal.

Then, you can observe the wave form on a scope, make hard copies on a strip chart or recorder, or feed the digital data directly to your computer—whatever is most convenient for you.

One of our family of wave form recorders is perfectly suited to your purpose. Prices begin at \$1850. For complete information, write or call Biomation, 1070 East Meadow Circle, Palo Alto, CA 94303. (415) 321-9710.

CSCC — STANDARD SUPERCONDUCTING MAGNETS

Specifications: clear bore 1.5"; overall length 6"; outer diameter 4" or 5" depending on field; homogeneity about 0.7% in 1" dsv (about 0.1% in 1 cm dsv). Charging rates typically better than 15kOe/min.

Field	Price
40 kOe	\$2,300
45	2,500
50	2,800
55	3,300
60	3,800
65	4,300
70	4,800
75	5,400
80	6,100
85	6,900
90	7,800
95	8,700
100	9,600
105	10,600
110	11,600

Prices FOB Montreal; Rental terms are available. Standard magnets can be upgraded in field at a later date for minor extra expense.

Each magnet is fitted with a magnetoresistive probe for field measurement. Persistent current switches and inexpensive power supplies for use with these magnets are also available.

Magnets carry full performance guarantee for one year from purchase.

the first to observe the spectrum of the hydrated electron, which had been postulated by Robert Platzman. He has also contributed to the statistical analysis of the results of radiation therapy and to the understanding of linear energy-transfer distribution.

The award was established in 1967 to honor Louis H. Gray, former vice-chairman of the ICRU. Before coming to the Institute of Cancer Research, Boag had worked with Gray at the research unit in radiobiology of the British Empire Cancer Campaign.

Five E. O. Lawrence Award winners named

Charles C. Cremer, of the Los Alamos Scientific Laboratory, Sidney D. Drell, of Stanford University and Paul F. Zweifel, of Virginia Polytechnic Institute are among the five recipients of the Atomic Energy Commission's Ernest Orlando Lawrence Memorial Award. The awards, consisting of a

gold medal, a citation and \$5000, recognize contributions to the field of atomic energy.

Cremer, a group leader of the theoretical design division at Los Alamos, was honored for his contributions to the development of weapons design codes and for his design of small weapons. The citation recognized Drell for his "theoretical investigations of the range of validity of quantum electrodynamics and for his contributions to understanding electromagnetic processes involving hadrons." Drell is deputy director and executive head of theoretical physics at the Stanford Linear Accelerator Center. Zweifel, a professor in VPI's department of physics, was cited for his "contributions to the slowing down and thermalizing of neutrons, which have been of particular importance to the design and development of water-moderated reactors."

The other two recipients were Marvin Goldman, a radiobiologist at the University of California, Davis and David A. Shirley, chairman of the chemistry department at the University of California, Berkeley.

Arno A. Penzias has been promoted to head of the radio techniques research department at Bell Laboratories, and Joe H. Mullins has been promoted to head of the T2 digital line department there.

Joining the staff of Los Alamos Scientific Laboratory are William P. Gula in the theoretical division and Gregg C. Giesler in the chemistry-nuclear-chemistry division.

At the University of Virginia, Stanley Sobottka has been promoted to professor and John Ruvalds and Hans-Jürgen Weber have been promoted to associate professors. Prabahan Kabir, formerly a visiting professor at the university, has been appointed professor. Other new appointments include Julian V. Noble, of the University of Pennsylvania, as associate professor and Paul M. Fishbane, from the University of Illinois and Ronald H. McKnight, from the University of Washington as assistant professors. R. Carter Morris and Richard J. Van Brunt, both previously research associates at Virginia, have been named assistant professors.

Norton L. Moise has joined Xonics Inc in Van Nuys, Calif. as director of operations and manager of the company's engineering physics division. He was previously with Montana State University.

Michael J. Brady, formerly of the State University of New York at Stony Brook, has become a member of the acousto-optical physics group at IBM's Thomas J. Watson Research Laboratories.

Erwin F. Shrader has been appointed director of research and development for nuclear-detection systems at the Harshaw Chemical Co's crystal and electronic products department.

William P. Raney, formerly special assistant to the assistant secretary of the navy, has been promoted to chief scientist for the Office of Naval Research.

Pennsylvania State University has named Roland H. Good, a senior scientist at the Ames Laboratory, to head the physics department.

George W. Wheeler, formerly of Brookhaven National Laboratory, has been appointed to the high-energy physics branch, division of physical research at the Atomic Energy Commission.

Lewis M. Branscomb has resigned as director of the National Bureau of Standards to become chief scientist and vice-president of research for IBM.

Promotions at Wayne State University include Harry H. Denman to professor and Pao-Kuang Kuo and William B. Rol-

...offers an overall light gain of 10^6 with a typical background of 10^{-10} lumens/cm². (light equivalent input.)

Typical operating voltage for these conditions is 40kV. The background indicated is for a tube having bialkali photocathodes.—tubes are also available with a range of S-20 cathodes for use out to 8,000 Angstroms. Input and output windows are flat Zinc crown glass, 50 mm diameter. Type 9693 is available with sapphire input window for use in the UV. Developmental types are now being made with fibre optic windows. All present types are furnished with P-11 phosphors throughout although other types of phosphors are under investigation □ Tubes are normally supplied potted in silicon rubber and a number of variations are available. A complete package, including electromagnet, divider chain, high voltage power supply and magnet supply is offered. A permanent magnet is also available □ An extensive technical manual, as well as useful application notes, are available on request. Write on your company letterhead to:
