Holier than Who?

Sir:

For some time I have been quite concerned about the fish-eyed stares the applied research men receive from those who are engaged in "pure" research. Too often a scientist speaks of returning to pure research after working on applied research with the air of a penitent sinner returning to the ways of godliness. By implication or expressed opinion, one is led to believe that there is something not quite clean about applied research and that if fundamental research is *pure*, then applied research is *impure* and *unclean*.

Let us eschew the words pure and basic and use only the term *fundamental* research. This is closer to the facts. Consider, for example, the arguments by which the use of Federal funds for the support of fundamental research—through a National Science Foundation or otherwise—is favored. It is contended that by subsidizing fundamental research something useful may be discovered which would not be found under a system which subsidizes only applied research. It is the utility of fundamental research that is called upon here! If one were to define fundamental research as work directed without regard to the use of the findings, their practical application, or immediate profit, and applied research as work directed toward some immediate and practical end, the difference between the two is reduced to one of practical and immediate utility.

Let scientists rid themselves of any idea that there is a taint to applied research or something holy about fundamental research. If applied research yields benefits to mankind, then its pursuit is as noble as any.

RADIUM D AND
POLONIUM FOR
RESEARCH

ALPHA SOURCES

Standard nickel electrode as illustrated. Threaded stem optional. Maximum active life assured by flash overcoat of gold. Special electrodes to your specifications.

BETA SOURCES

Standard nickel electrode. Active surface protected by micro-thin aluminum foil, assuring a pure beta emitter. Special electrodes to your specifications.

NEUTRON SOURCES

Feature extremely low gamma radiation. Highly compressed Beryllium mixtures in monel alloy or magnetic metal capsules. Standard ratio 1:10, activity of Radium D or Polonium to weight of Beryllium, can be varied to meet your requirements.

Radium D and Polonium also available as highly purified nitrate crystals, readily soluble in N/10 nitric acid. Quantity in millicuries as specified.

For prompt delivery of anything in radium or associated products:
