Black-Body Theory and the Quantum Discontinuity, 1894-1912

THOMAS S. KUHN. This book traces the gradual emergence of the concept of a discontinuous physics which revolutionized the field in the early part of the twentieth century. The author traces the work of Max Planck, whose study of black-body radiation introduced the problem of discontinuity, and then goes on to discuss the reactions of Ehrenfest, Einstein, and Lorentz to Planck's novel theory. The book includes a survey of the state of the quantum in 1911-1912, the important period when discontinuity was becoming an established theory in modern physics.

1978 512 pp. \$24.00

Cosmical Magnetic Fields

Their Origin and Their Activity

E. N. PARKER. An investigation of the universal spontaneous generation of magnetic fields in astronomical bodies, this book describes the general properties of magnetic fields, their appearance throughout the astronomical universe and their effects. The nonscientist with an active interest in astronomy will find extensive material in readable form, while the professional astronomer will find a systematic presentation of the theory. (International Series of Monographs on Physics)

February 1979 848 pp.; 125 line diagrams \$84.00

Cosmology and Geophysics

PAUL S. WESSON. Geophysical studies of the earth may provide evidence to support recent cosmological theories that the gravitational constant has varied throughout time. This book critically reviews the various theories and examines their consequences and observable effects upon the earth and other planets. (Monographs on Astronomical Subjects)

January 1979 239 pp.; illus. \$24.95

The Nature and Origin of Meteorites

D. W. SEARS. The study of meteorites is relevant to such diverse questions as the formation of the solar system and the origin of life on earth. This interdisciplinary work reviews the chemical, physical and mineralogical properties of meteorites, explains their classification and discusses various theories of their origin in light of observational evidence. (Monographs on Astronomical Subjects)

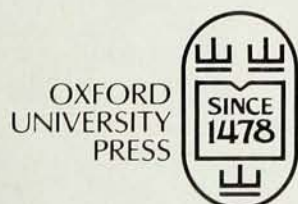

January 1979 178 pp.; illus. \$17.95

Applications of Early Astronomical Records

F. RICHARD STEPHENSON and DAVID H. CLARK. Pre-telescopic observation can yield valuable astronomical information and this book describes the application of historical records to problems in modern astrophysics. In particular, the authors relate eclipse records to the variation in the rotation of the earth, apply "new star" observations to the study of novae and supernovae, and use sightings of sunspots to investigate long-term solar variability. (Monographs on Astronomical Subjects)

January 1979 112 pp.; illus. \$12.00

Advanced texts from an Advanced source.

BIOPHYSICAL SCIENCE, 2nd Edition

Eugene Ackerman, Lynda B. Ellis,
and Lawrence E. Williams —

all of the University of Minnesota, Minneapolis

To accommodate the progressive changes made in biophysics over the past decade, the authors have revised, updated or replaced **all** chapters of BIOPHYSICAL SCIENCE. The sections on Physical Biology, and Specialized Instrumentation and Techniques have been thoroughly revised. Chapters on proteins and nucleic acids, enzymes, radiation, and electromagnetism have been completely updated. New material includes: irreversible thermodynamics; membrane physiology; and echosonography.

Text carefully initiates students into biophysics and assumes prerequisites in elementary calculus, biology and physics. Topics have been chosen for their importance, and also for the suitability of presentation in a one-term course. Groups various chapters by the type of problem described, thus allowing teachers and students the opportunity to concentrate on selective areas. Appropriate for pre-medical or biomedical engineering students or for the industrial physicist.

1979 625 pp. (est.) Cloth \$24.95

INTERMEDIATE CLASSICAL MECHANICS

Joseph Norwood, Jr. — East Carolina University

Up-to-date and technically accurate text was written from the premise that classical mechanics should include **not only** particle mechanics and rigid bodies, **but also** many-particle systems — often neglected in advanced level texts. Provides students and teachers with a thorough treatment of these systems from **both** a fluid and statistical point of view. Problems at the end of each section help students apply what they have learned from previous chapters.

Two semesters of calculus are prerequisite to the use of the text, with a corequisite of a course in ordinary differential equations. Suitable as one or two semester text, and as a ready reference for professional physicists.

1979 464 pp. (est.) Cloth \$22.00

Prices subject to change without notice.

NEW ARC LAMP SYSTEMS

- 6-10X more power for given lamps
- Allows for use of lower-powered lamps for REDUCED OPERATING COST.
- Compact
- Excellent stability
- Versatile

The regulated power supplies are:

- modulatable up to 50KHz
- capable of pulsed mode operation
- highly regulated
- low RF, filtered single pulse starters

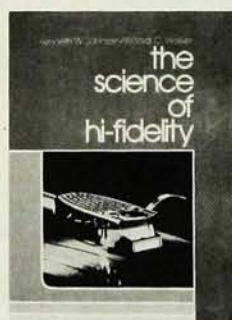

The supplies can power most arc lamps from 75w-1000w

An innovative and effective way to teach introductory physics

The Science of Hi-Fidelity

Kenneth W. Johnson
and Willard C. Walker
Southern Illinois University

1977/544 pages/Paper/\$14.95
ISBN 0-8403-1753-0

The Science of Hi-Fidelity uses a subject of intrinsic interest to students as a vehicle for presenting most of the basic laws of physics in a unified and coherent manner. The scientific scope of hi-fi is so comprehensive that most of the traditional areas of physics must be thoroughly understood and integrated for students to be able to understand the principles of hi-fi operation. Successfully used at SIU and very popular with students, this approach doubled semester enrollments and decreased drop-out rates.
