

annual meeting.

The presence of Fusion Energy Foundation at the APS Plasma Division meeting in San Diego was not official, nor were they invited. It has been the policy of the division to allow members of the division to post notices, hold rump sessions, set up tables for distribution of materials and so on, at our annual meeting if they do not interfere with or disrupt the flow of the scientific information exchanged at the meeting. In that spirit, many diverse groups have availed themselves of this freedom over the years, including groups recommending action on discrimination, repression of scientists by Soviet block countries, government bureaucracy and other matters. This year F.E.F. chose to participate, along with others.

Anti-F.E.F. groups could, of course, also have participated if they chose. We have not known in advance who will lobby at our meeting. This policy has now been changed. Because of the trade exhibits which have been part of our meeting for the last three years and the increasing number of special interest groups, it was decided at the Division of Plasma Physics Executive Committee meeting in San Diego that in future meetings such groups will be required to rent booths at the exhibit, along with the other exhibitors. This seems only fair.

While it may not be relevant, I personally prefer to have the special interest groups sitting quietly at a table with magazines and pamphlets rather than pacing in front of the building accosting people with billboards. Further, if there is strong sentiment against our current practice of controlled permissiveness with regard to exhibits, use of our bulletin boards and so on, it could be brought up at the Annual APS/DPP Business Meeting and changed.

Book review apology

I read with considerable interest the review of *Electron-Positron Interactions* by B. H. Wiik and G. Wolf in October (page 75). I was quite delighted to see such a detailed review, which was also attractively illustrated.

The book is concerned with most up-to-date research in the field where two major institutions, one in the USA and the other in Germany, have greatly advanced our knowledge of high-energy physics. We felt that we would serve the scientific community by providing this rather up-to-date survey. As a result, we received the manuscript

Our new, slower, cheaper array processor.

Our new MSP-3X is only about half as fast as our MSP-3. But at \$4950 its price is also less than half that of any other array processor on the market.

"Slower," of course, is relative: MSP-3X lets your PDP-11 computer perform arithmetic and signal analyses 20 to 50 times faster than it can alone. A 1024-point real Fast Fourier Transform in 14.3 milliseconds, for example.

That's plenty of speed for most analyses of vibration, sonar, communications, radar, medical image, and dozens of other kinds of data.

And you needn't sacrifice convenience, either. Operation is simple and reliable, based on straightforward execution of an extensive library of functions, accessed through Fortran calls. And MSP-3X's two hex boards simply plug into your PDP-11.

All in all, MSP-3X is a most intelligent trade-off. Write us for detailed specifications.

letters

in April 1979, the book was published in *December* of the same year and, according to our records, a review copy was airmailed to *PHYSICS TODAY* one week later.

We are, therefore, shocked about the last statment of the review which asserts that our book appeared two years after it had been written. This statment cannot be left without critique, since it adversely affects the reputation of Springer-Verlag.

Though it was stated in the Preface that the origin of this book goes back to the lectures given by the authors at the various schools and conferences, the book manuscript had been revised and updated before it went into print. Thus it really cannot be said that the book was published with a two-year delay.

THE REVIEWER COMMENTS: The authors and publisher of *Electron-Positron Interactions* have done a creditable job of preparing a well-written summary of the status of the field in a time which for the textbook industry must be considered short. It remains true, however, that in August 1980, when I received the book for reviewing, it was not an up-to-date survey. Although about 4% of the references are indeed from early 1979, the bulk of the book is essentially the same as the DESY 78/23 report of May 1978. Important recent work on gluon bremsstrahlung, the η_c , higher Υ states, and the B mesons could not be included. It would have been a disservice to the potential consumer not to have pointed this out in the review.

It is of course not the fault of the authors or the publisher that this is such a rapidly moving field of physics. I apologize if my final statement gave the impression that I was chastizing them for being dilatory. It was merely meant to point out an unfortunate fact of life in this field. It would also have been fairer to the publisher if I had rounded the time lapse down to one year instead of two, especially in light of the several possible interpretations of the age of the book.

Librarians beware

We recently ordered the book "Bibliography of Fiber Optics Technology and Applications," published by Information Gatekeepers, Inc. The price of this publication is \$90.00, and for this

amount we received a booklet that must have been published by a local high school. The information given in the booklet leaves a lot to be desired, the pages were xerox copies, and they were numbered incorrectly and poorly connected.

Therefore, we suggest to all other libraries to watch out before they purchase any publication from Information Gatekeepers.

Interviews in Asia

The Physics Interviewing Project, in its twelfth year of operation, is planning for its next interviewing trip which will take place in the Fall of 1981. Informational material on the program, together with participation forms, has been mailed out to all chairmen of US physics departments which have a PhD program, and also to selected institutions in Canada, Britain and Australia. The interviews will again cover Asian countries ranging from South Korea to Pakistan. The objective of the program is to generate, through individual interviews with applicants to US graduate schools in physics, reliable information on such applicants regarding their preparation and potential for graduate study. For further information contact M. J. Moravcsik (U. of Oregon) or M. Scadron (U. of Arizona).

Home for accelerators

The interview (November, page 61) with John Deutch on his experiences in DOE included a discussion of the proper agency setting for high-energy accelerator physics (HEAP). The presence of that program in DOE is clearly a matter of historical accident, or, as Deutch said, "it may not make great sense in principle."

The only alternative to the DOE considered in the interview was the NSF, and it was found wanting on several counts. The purpose of this letter is to raise again the question raised previously at a meeting of GAO consultants, of placing HEAP in the National Aeronautics and Space Administration (NASA).

NASA has the expertise in management of large facilities which NSF lacks. Its scientific programs in cosmic rays and high-energy astrophysics, for which it provides essential support, embrace scientific interests which overlap those of high-energy accelerator physics. And the scale of NASA activities is so large that the absorption

of HEAP would not create the lopsidedness which would result from transfer to NSF. NASA's present programs in astronomy are very similar in dollar size to the present high-energy accelerator physics programs—about one-third of a billion dollars per year.

Bringing HEAP into the same fold as other programs which are similar in scale and in general scientific-philosophic purpose should make the processes of resource allocation in pure science—always a problem of formidable difficulty—somewhat less formidable, and should encourage cross-fertilization of programs which are now under very different management auspices.

With the future of DOE itself in question, the NASA option is a timely alternative.

Anonymous refereeing

Christopher Sherman's letter (January, page 15) may arouse support for a principle of "equal anonymity" for authors and referees. But perhaps his suggestion does not go far enough.

Some artists make a living in circumstances which in some ways resemble those of physicists. The artists sell their works and gain recognition at art shows. In invitations to submit work for shows one commonly sees the names of the jury members who will choose objects for display and special recognition at the shows. It is also common that names of artists are concealed from juries until after the selections have been made.

Is it possible that artists are smarter than physicists, and have consequently achieved a more open and just arrangement?

Mirages

I read with interest your news story on the Novaya Zemlya effect and optical ducting of objects beyond the horizon (January, page 21). I have on several occasions seen similar effects on Lake Michigan, such as lingering of the last bit of the sun until well past when it should have set. On one occasion I even recall its brief reappearance. The appearance of over-the-horizon land points as floating islands (Gunnbjorn's "skerries") is also a very common sight.

These effects seem to occur most frequently on cool, clear days. Undoubtedly they are associated with air temperature gradients near the water surface.
