

WE HEAR THAT

Lawrence. He was a key figure in the development of the first cyclotrons; with Sten von Friesen, he built the first European cyclotron in Copenhagen. While a professor at Iowa State University (1946-63), Laslett made many significant and meticulous contributions to weak-focusing synchrotron design. As a participant in the Midwestern Universities Research Association he was a leader in the development of alternating-gradient focusing theory, the concept of colliding beams and nonlinear orbit theory. Laslett was also a pioneer, with James Snyder and Richard Christian, in the use of digital computers for calculating electromagnetic fields from Maxwell's equations. He also used computers to study particle orbits and to show that there is a real phenomenon of chaos.

Laslett served the government in many ways. During World War II he worked at the MIT Radiation Laboratory on the development of airborne radar. He was a member of the Office of Naval Research in both Washington (1952-53) and London (1960-61), and he was the first head of the high-energy physics branch of the Atomic Energy Commission (1961-63).

In 1963 Laslett went to Lawrence Berkeley Laboratory, where he continued to be a leading figure in accelerator design and theory. He made major contributions to the Electron Ring Accelerator, the Heavy Ion Fusion Accelerator program and the subject of collective instabilities.

Laslett's contributions and influence were immense. While he was exceedingly quiet, he nonetheless shared his insights, work and perspective in such a way that a host of people in the field came to revere him as a mentor. He was a joyous person, always eager to work and to discuss physics. It was a great joy to work with him.

Richard E. Cutkosky

Richard E. Cutkosky, the Buhl Professor of Physics at Carnegie Mellon University, died on 17 June 1993 following a stroke. Born on 29 July 1928, he was 64 years old.

CHARGE SENSITIVE PREAMPLIFIER

A250

RUN SILENT — RUN FAST!!!

If you are using: Solid State Detectors, Proportional counters, Photodiodes, PM tubes, CEMS or MCPs and want the best performance, try an AMPTEK CHARGE SENSITIVE PREAMPLIFIER

Send for Complete Catalog
One year warranty

Features:

- Low noise (less than 100 electrons RMS)
- Low power (5 milliwatts)
- Small size (Hybrids)
- High Reliability
- Radiation hardened (as high as 10^7 Rads)

Applications:

- Aerospace
- Portable Instrumentation
- Nuclear Plant Monitoring
- Imaging
- Research Experiments
- Medical and Nuclear Electronics
- Electro-Optical Systems

WORLD-WIDE SALES DIRECT FROM THE FACTORY

AMPTEK INC.

6 DE ANGELO DRIVE, BEDFORD, MA 01730 U.S.A.

TEL: 617-275-2242

FAX: 617-275-3470

Circle number 43 on Reader Service Card

STATE-OF-THE-ART

EXTERNAL FET

FET CAN BE COOLED

NOISE: < 100e⁻RMS (Room Temp.)

< 20e⁻RMS (Cooled FET)

POWER: 19 mW typical

SLEW RATE: > 475 V/μs

GAIN-BANDWIDTH f_T > 1.5 GHz

CHAOS

An
Interdisciplinary
Journal of
Nonlinear Science

Chaos brings you the most recent developments, speculations, and debates in nonlinear science from the international research community. Contributions to this peer-reviewed journal are gathered from diverse disciplines, including physics, mathematics, chemistry, biology, engineering, and the social sciences.

Published quarterly, **Chaos** offers you a broad spectrum of information in the form of original research articles, technical reviews, and pedagogical surveys. You'll also discover translations of key papers by Russian scientists and special "focus" issues containing collections of related articles highlighting topics of current interest.

Subscribe now and see why **Chaos** is forcing a fundamental reassessment of the way in which we view the physical world.

Richard E. Cutkosky

Cutkosky took all his degrees at the Carnegie Institute of Technology (now Carnegie Mellon University), receiving his PhD in physics in 1953 under the direction of Gian-Carlo Wick. After a year at the Niels Bohr Institute, Cutkosky joined the faculty of Carnegie Institute of Technology; he was named Buhl Professor in 1963.

Much of Cutkosky's work concerned the analytic properties of scattering amplitudes. Following the work of Lev Landau, Cutkosky derived general formulas for the discontinuities across cuts in Feynman amplitudes. The Cutkosky rules remain a basic tool in particle physics calculations.

His major concern during the 1960s was understanding the excited states of baryons. He worked on supermultiplet symmetry, its possible bootstrap origin and the interrelations among the deviations from it. Cutkosky's interest in baryon excited states led him to explore methods of analyzing pion-nucleon scattering data. He developed a conformal transformation that could be used to improve the usual partial wave expansion method. For many years Cutkosky and his associates applied his methods, providing comprehensive analyses of pion-nucleon scattering data. This work led to the finding of many baryon resonances that serve as major tests of the constituent quark model. Cutkosky contributed regularly to the *Review of Particle Properties* and was one of the editors of the π -N Newsletter.

With his students and postdocs, Cutkosky had recently been studying nonperturbative quantum chromodynamics. In contrast to the standard lattice methods, Cutkosky developed

a hyperspherical expansion that retained the spherical symmetry of the theory. This work provided interesting insights into the problem of confinement and the properties of glueballs.

Dick was a dedicated teacher and an active environmentalist. He served as chairman of the Carnegie Mellon science faculty for 1990-91. He will be missed by his colleagues at the university and his associates around the world.

Frank Lee Galeener

Frank Lee Galeener, a professor of physics at Colorado State University, died peacefully at home on 6 June 1993, after a long and valiant battle with esophageal cancer.

Frank was born on 31 July 1936 in Long Beach, California. He earned his SB and SM degrees in physics at MIT (1958 and 1962, respectively) and was a staff member at the MIT Lincoln Laboratories (1959-61) and at the National Magnet Laboratory (1961-64). Following receipt of his PhD in physics from Purdue University in 1970, he became a founding member of the research staff at the Xerox Palo Alto Research Center. In 1977 he became a principal scientist at Xerox PARC. During and just after his tenure there, he held visiting positions at the University of Oxford (1982), the University of Cambridge (1983-84) and the University of Paris VI (1988). He moved to Colorado State University in 1987.

Although his PhD studies were in solid-state theory, Frank rapidly converted himself into a consummate experimentalist, developing a state-of-the-art Raman spectroscopy laboratory at Xerox PARC that later formed the nucleus of a diversified glass physics laboratory at Colorado State University. Early in his career, his interests were centered on the atomic and vibrational structures of amorphous solids and thin films. Among his most important achievements were his demonstration of the splitting of transverse and longitudinal optical modes in glasses, the determination of selection rules for Raman and infrared absorption in glasses, the study of intermediate-range structural order in glasses and the identification of planar three-ring structures in glassy SiO_2 . In recent years he bravely shifted into the highly competitive field of point defects and radiation-damage mechanisms in silica glasses. He and his

Frank Lee Galeener

collaborators promptly discovered that the defect production efficiency had unanticipated dependences on both the fictive temperature of the glass and the energy of the defect-inducing x-ray photons.

Frank was greatly admired for the energy and originality that he brought to the study of the physics and chemistry of glasses and for the rigorous standard of proof that he imposed on all proposed models of glass structure, including his own. He was greatly loved and will be long remembered by his numerous friends and colleagues for his courage, his kindness and his rich sense of humor. He was generous, helpful, fair and never less than considerate in his dealings with his students, his collaborators and even his (very rare) detractors.

Dieter K. Wohleben

Dieter K. Wohleben, a professor of physics at the University of Cologne, died on 19 July 1992 in Germany as a result of an automobile accident. Born on 23 April 1935, he was 57 years old.

Wohleben earned the degree of *Diplom* in 1961 at the Technical University of Berlin. He received his PhD in physics in 1968 from the University of California, San Diego, in the research group of Bernd T. Matthias. His thesis research involved measuring the magnetic susceptibilities of scandium, yttrium,
