Darwin Returns to Kansas

Scientists and educators in Kansas are breathing easier now that two of the six anti-evolutionists on the state's board of education lost their primary elections in August and a third resigned, assuring that the theory of evolution will be reinstated in the state's K-12 science standards.

"We're headed in the right direction," said John Staver, director of the Center for Science Education at Kansas State University. The board's new makeup means that a majority will be "back in the moderate direction," he said.

Staver was a cochair of the 27-member committee of science teachers, educators, and scientists that two years ago wrote a lengthy set of standards for K-12 science education in Kansas. The board adopted the standards, but only after voting 6 to 4 to revise them and cut all references to Darwinian evolution, the Big Bang, the age of both the universe and Earth, and, curiously, global warming. (See PHYSICS TODAY, November 1999, page 59.)

The standards are the basis for the statewide achievement tests all students must take beginning in 2001. While the board didn't ban the teaching of evolution and cosmology outright, scientists and educators alike feared that without the standards to back them up, many teachers would avoid what to some are controversial subjects.

The state's 1 August Republican primary election became a referendum on evolution versus creationism when three of the conservative incumbents were challenged by Republican moderates who campaigned on the issue of putting real science back in the standards. The outcome is seen as a victory for grassroots organizing by scientists and others in the state. The most telling defeat was of Linda Hol-loway, who spearheaded the anti-evolution effort and spent about \$90 000 on her reelection bid. Her challenger, Sue Gamble, spent about \$36 000 and won 60% of the vote.

"I would like to think public education by the Kansas Citizens for Science [a group that coalesced around the science standards issue] made the

difference," said Adrian Melott, a University of Kansas cosmologist. "Our focus has been not to campaign, but education. We held public lectures and we targeted newspapers and radio. We didn't let any of [the anti-evolution claims] go unchallenged."

While the original 27-member science standards committee was disbanded after turning in its recommendations more than a year ago, Staver planned to call the group back together on 9 September to review its original standards and have them ready for the new board, which takes office 1 January.

There is still the general board of education election in November, but for this issue who wins doesn't matter because the majority of the Republican and Democratic candidates have stated they will overturn the anti-evolution vote.

This battle has been won in Kansas, Staver said, "but there will never be a time to relax because this kind of thing has been going on since Darwin published the *Origin of Species*. The folks on the [creationist] side of this issue believe they are right, and they believe absolutely."

Each month, Yakov Kantor, a condensed matter physicist from Tel Aviv University in Israel, updates his *Physics Questions/Problems* Web page with a new puzzle. If you submit an answer, Kantor will review it and, if he thinks yours is the best, he'll publish it on the site. The latest puzzle concerns a radiating spherical shell with a time-dependent radius.

<http://www.nobel.se/physics/articles/fusion/index.html>

The official Web site of the Nobel Foundation currently highlights an article by John Bahcall of Princeton's Institute for Advanced Study. Entitled *How the Sun Shines*, Bahcall's article takes a historical approach, beginning with 19th-century estimates of the Sun's age and ending with the discovery last year of neutrino oscillations.

<http://physics.nist.gov/GenInt/Curie/main.html>

From the physics laboratory of the National Institute of Standards and Technology comes Marie Curie and the NBS Radium Standards, an extensive Web site that describes Curie's role in establishing radiation standards at NIST's forbear, the National Bureau of Standards. Curie died in 1934, but the Web site continues with the story of radiation standards right up to the present day.
