NOW YOU CAN ACCURATELY MEASURE TO ONE-MILLIONTH OF AN INCH

with the HENDRIX INTERFEROMETER made by DAVIDSON MANUFACTURING CO.

An interferometer, which measures by light waves, is the most accurate of all optical measuring devices.

The Hendrix Interferometer, Model 302, is particularly valuable because it is so easy to use. It has remarkable stability under normal laboratory conditions. It does not require highly skilled operators.

With it you can quickly see the defects of surface figure in optical elements such as windows, wedges, prisms or reflectors and you can also see internal glass defects. You can measure and photograph the quality in a complete optical assembly and evaluate the total error.

Hendrix Interferometers are made in a range of working apertures from 3 to 10 inches.

This instrument may be the solution to your critical inspection problem. We will gladly send you a booklet explaining the Model 302 in detail.
